## MINIGLOSSARY TIMERS

### Accuracy

The variation of unit performance, i.e., time delay, voltage trip point, etc., over the specified conditions of ambient temperature, input voltage range, and time between operations.

### Adjustability

The changing of a unit set point, within the specified range of unit operation, by means of internal or external adjustment mechanism (i.e., changing time delay with potentiometer).

### Contact Rating

The electrical power-handling capability of relay contacts under specified environmental conditions and for a prescribed number of operations.

### Delayed Interval Timing Function

Input voltage is applied continuously. The timing cycle is started by momentarily actuating the control circuit. The functions of separate Delay-On-Operate and interval type timers are combined in one package providing a single OFF-ON-OFF output cycles

*Also called:* single shot.

### Delay-On-Operate Timing Function

Application of the input voltage starts the time delay. At completion of the time delay, the relay contacts transfer.

*Also called:* Delay-On-Make, On-Delay, Delay Relay, Delay-On-Pickup.

### Delay-On-Release Timing Function

Input voltage must be supplied continuously to timer. Actuation of control circuit causes relay contacts to transfer immediately. Time delay starts when control circuit is released. The relay remains energized for the duration of the time delay—then de-energizes.

*Also called:* Delay-On-Break, Off-Delay, Delay-On-Dropout, Delay-On-Energization.

### Frequency Sensor

A device that monitors a predetermined overfrequency and/or underfrequency condition, and changes output state when these conditions exist.

### Hysteresis

The difference between the response of a unit or system to an increasing and a decreasing signal (example: a voltage sensor).

### Interval Timer Timing Function

Application of input voltage causes relay contacts to transfer and time delay to begin. At completion of the time delay, the relay contacts return to de-energized state.

*Also called:* Delay Interval, One Shot.

### Output Control

The switching device, either solid-state or electromechanical, used in the unit to control the load connected to the output terminal(s).

### Phase Sensor

A device that monitors for proper phase rotation in 3-phase systems.

### Programmability

Ability to modify function, time delay or input voltage of a timer.

### Recovery Timer

#### (Delay-On-Operate/Interval Timer)

The minimum time that input voltage must be interrupted *prior* to time-out to insure a successive timing cycle within the specified limits.

#### (Delay-On-Release)

The minimum duration of time that control circuit must be re-actuated to insure a new timing cycle when the control circuit is released.

### Recycle Time

#### (Delay-On-Operate or Interval Timer)

The minimum time that input voltage must be interrupted after the

timing cycle is completed to assure a successive timing cycle within the repeatability specified.

### (Delay-On-Release)

The minimum duration of time that control circuit must be actuated to insure a successive timing cycle within the repeatability specified when the control circuit is released.

### Repeat Cycle Timer Timing Function

Application of power automatically initiates continuous off-on cycling of the output relay.

*Also called:* flasher, intervalometer

### Reset Time

The time required for the contacts to return to normal position when power is removed.

### Reverse Polarity Protection

Blocking circuitry arrangement within the timer to prevent damage or output actuation if reverse polarity input voltage is applied.

### Tolerance

The difference between specified and actual timing or sense point (factory setup tolerance).

### Transient Protection

Prevents damage to unit if positive or negative transients are applied to the unit. Insures proper operation of the unit during and after transient occurrence. Max. transients are usually specified as to amplitude and duration, i.e., 1000V for 1 second.

### Trip Point

The predetermined point at which a sensing device is set to change the output state.

### Voltage Sensor

A device that monitors for a predetermined overvoltage and/or undervoltage condition, and changes output state when these conditions exist.

# 93 94 Manufacturers and Sales Offices Directory

Each manufacturer is listed alphabetically with complete address and telephone number of main offices. The names of those with data pages in this edition of EEM are shown in **boldface**.

Many manufacturers also show FAX, TWX and Telex numbers, FSC (Federal Supply Code), other pertinent company data, their sales and/or local distributor offices and phones. The page numbers of their data pages in this edition are shown in all volumes.
